Coliform bacteria in well water: What you should know

Coliform bacteria are part of a broad group of bacteria found in soil, water and vegetation. Coliform is also found in the intestines of humans and other warm-blooded animals. Coliform can enter your well through groundwater, surface water run-off, cracked or broken well parts, poor construction, and leaking septic tanks. Coliform in your well water can mean there are disease-causing organisms such as *E. coli*. *E. coli* is a sign of fecal matter and can cause health problems.

**Coliform bacteria and your health**

If total coliforms (*E. coli*) are in your well water, you may have diarrhea, cramps, nausea, headaches or other symptoms. Infants, young children and people with compromised immune systems are at a higher risk.

Testing for coliform is the most common way to know if your drinking water is contaminated and unsafe to drink. Contact an accredited laboratory for specific instructions on how to collect, store and send the sample. The test will cost between $25–$40. To find accredited labs in Oregon, visit [www.healthoregon.org/wells](http://www.healthoregon.org/wells).

If your water has a positive test for total coliform, it should also be tested for *E. coli*. If positive for *E. coli*, you should switch to bottled water or another source of safe drinking water and seek treatment options.
